

## HGH—Human Growth Hormones For Men

Men have a variety of options for anti-aging therapy. HGH (**Human Growth Hormone**), hCG (**Human Chorionic Gonadotropin**), and testosterone make up the array of hormones available to you. You and a doctor will decide which—or all—are right for you. It's your personal HRT—hormone replacement therapy.

You won't wake up in a month with six-pack abs, but you'll be on your way to . . .

- Higher energy . . . in bed and out
- Great sex . . . no . . . the best sex ever. Function, performance, desire.
- Increase in lean muscle mass and decrease of body fat without exercise and diet . . . and huge changes if you combine HRT with a work-out program and sensible eating.
- Better function of important organs . . . heart, kidney, liver, and more
- Lower blood pressure
- Improved immune function
- Better cholesterol profile . . . higher HDL, lower LDL
- Younger looking skin and hair
- Sharper vision
- Better moods
- Improved sleep time and quality
- Improved memory

If it sounds too good to be true, you should know that lots of men tell us that it's the perfect combination—the experience they have today with the energy and vitality they had 10 or 20 years ago.

Here are the hormones you and your doctor will consider:

**HGH—Human Growth Hormone**—is the hormone, produced in your pituitary gland, that made you grow to your current height. That's the most obvious effect of HGH. Once we reach adult height, our bodies produce less HGH. We stop getting taller, but we lose the other benefits that come from HGH. As an adult, a little extra HGH can help you increase muscle, reduce fat, strengthen bones, boost your immune system, and feel as good as you did in your prime.

**Testosterone**—is known as the male hormone. Despite the fact that women have it too—only in tiny amounts. In men, a healthy level of testosterone ensures healthy testes and prostate. It's responsible for what you know as "male"—heavier bones, increased muscle mass, deeper voice, and facial and body hair. It's also responsible for your libido and your ability to have an erection. When you have too little testosterone, you lose the part of you that's male.

**hCG—Human Chorionic Gonadotropin**—is a hormone produced by pregnant women. Just like hCG helps produce a healthy baby, it can work wonders on you. In men, hCG combined with HGH, boosts naturally produced testosterone and targets stored fat, tightens sagging skin, and halts—or reverses—muscle loss.

### **What will your anti-aging HRT program include?**

After a blood test and consultation with a physician, you'll start on a personalized program. But we can tell you that most men get maximum benefit from a combination of HGH, testosterone, and hCG.

You and a physician may decide to start you on HGH . . . by itself for four to six weeks. Then, when your cells have started to regenerate, you'll add in testosterone and an estrogen blocker. Once you're on this combination for three or more weeks, you'll want to add in hCG. It will make sure your body doesn't learn to depend on testosterone supplements. hCG will kick-start your own testosterone production.

**Hormone Replacement Clinic**  
**2800 West State Road 84, Suite 118**  
**Fort Lauderdale FL, 33312**
